Rover Technology Fusions Forges Partnership with Sell-Tech Solutions to Reach the Northeast with its Security and Backup Solutions

(Tampa, FL – April 10, 2007) – Rover Technology Fusions, a Tampa technology solutions provider, announces a sales partnership with Sell-Tech Solutions of Hatboro, PA. This independent sales agreement combines Sell-Tech’s expertise as an enterprise solutions provider of data security and secured remote access products with Rover’s disaster recovery, backup, workflow mobile data, and security solutions. Products to be marketed through the partnership include: Rover ARC, Rover Ink mobile computing and data capture, and SureView System’s event-driven video and access control security solution.

“Rover’s unique solutions for physical security and data backup make this partnership a natural fit for Sell-Tech,” said Ron Prickitt, CEO of Sell-Tech. “It is imperative that we continue to enhance our current portfolio of solutions for data security and secured remote computing with the latest technology and a domain-knowledgeable staff. We believe that Rover is a great manufacturing and solutions partner for Sell-Tech and our customers.”

Rover ARC is an enterprise-class computer dedicated to backing up and protecting electronic files. The ARC server resides at a customer's business location, copying files from the network or individual workstations onto its hard drive. Every four hours, ARC automatically sends changes to files (since the previous backup) to Rover’s Category-5 data vault facility where it is accessible from any Internet connected computer. Remote access to files allows a business to restore and continue operations from various locations and remotely exchange information with home-based employees, field representatives, and satellite offices.

“We are excited about the opportunity to market our technology solutions to the Northeast Corridor,” said Simon Morgan, General Manager of Rover Technology Fusions. “This partnership with Sell-Tech will help Rover further expand its sales reach across an important geographic region.”
